Product description:

NSB-401-ST - Positioing sling (loops)

The positioning sling allows for the transport of inert patients in a lying position who are unable to support or control their bodies independently. Made from ventilated material, these slings fit most hospital beds and are designed to prevent skin breakdown, allowing them to remain behind the end-user for short periods of time. Ideal for critical care units, they can be placed behind the patient like a sheet. These slings are perfect for sudden or intended positioning, repositioning, turning, and lateral transfers. They are compatible with patient lifts featuring four-point hanger bars.

Features:

Suspension for turning and repositioning patients,

Material designed to ensure airflow

Ideal for critical care unitsand patients without body and head stabilization

Eight reinforced straps (six for the body, two for the head)
