TECHNOMEX

Shoulder

VECTIS uses elastic resistance in the comprehensive rehabilitation of the shoulder joint. The device can perform the following movements:

- ?internal / external rotation
- ?abduction/adduction
- ?flexion/extension

The device is designed to work with elastic resistance elements, which the most important advantage is to generate a slight resistance in the initial phase of the movement, increasing evenly in the later stages of the exercise. Due to these properties Vectis Mini is particularly useful in the post-traumatic, post-surgical, orthopedic and neurological rehabilitation. The device is also used in sports rehabilitation, rheumatology and geriatrics.

VECTIS as a part of ACX.rehab concept, using software so that the patient is aware of the challenges and progress in rehabilitation which increases patients motivation.
