Shoulder

VECTIS MINI uses elastic resistance in the comprehensive rehabilitation of the shoulder joint. The device can perform the following movements:

- ?internal / external rotation

The device is designed to work with elastic resistance elements, which the most important advantage is to generate a slight resistance in the initial phase of the movement, increasing evenly in the later stages of the exercise. Due to these properties VECTIS MINI is particularly useful in the post-traumatic, post-surgical, orthopedic and neurological rehabilitation. The device is also used in sports rehabilitation, rheumatology and geriatrics.

VECTIS MINI as a part of ACX.rehab concept, using software so that the patient is aware of the challenges and progress in rehabilitation which increases patients motivation.
